# Chapter 6 – Windowed Tables and Window Functions in SQL

Recent Developments for Data Models

## **Outline**

Overview

#### I. Object-Relational Database Concepts

- User-defined Data Types and Typed Tables
- 2. Object-relational Views and Collection Types
- 3. User-defined Routines and Object Behavior
- 4. Application Programs and Object-relational Capabilities

#### II. Online Analytic Processing

- 5. Data Analysis in SQL
- 6. Windowed Tables and Window Functions in SQL

#### III. XML

- 7. XML and Databases
- 8. SQL/XML
- 9. XQuery

#### IV. More Developments (if there is time left)

temporal data models, data streams, databases and uncertainty, ...

2

Recent Developments for Data Models

#### Windowed Table Functions

- Windowed table function
  - operates on a window of a table
  - returns a value for every row in that window
  - the value is calculated by taking into consideration values from the set of rows in that window
- 5 new windowed table functions
  - RANK () OVER ...
  - DENSE\_RANK () OVER ...
  - PERCENT\_RANK () OVER ...
  - CUME\_DIST () OVER ...
  - ROW\_NUMBER () OVER ...
- In addition, 8 old aggregate functions and 16 new aggregate functions can also be used as windowed table functions:

Example: sum(salary) OVER ...

Allows calculation of moving and cumulative aggregate values.

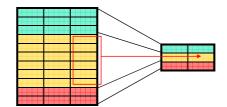

3

Recent Developments for Data Models

# Concept (Compared To Set Functions)

Set functions (aggregate functions)

> SELECT dept, AVG(salary) FROM Employees GROUP BY dept

 Windowed Table Functions (tuple-based aggregation)

SELECT dept, empno, salary,
AVG(salary) OVER(
PARTITION BY dept
ORDER BY age
ROWS
BETWEEN 2 PRECEEDING

AND 2 FOLLOWING)
FROM Employees

. .

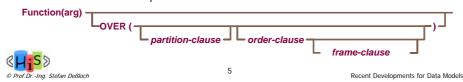

4

Recent Developments for Data Models

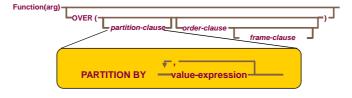

#### Windowed Tables and Window Functions

- Windowed table
  - table (result of a table expression) together with one or more windows
  - windows are independent from each other
- Window
  - defines, for each row in the table, a set of rows (current row window) that is used to compute additional attributes
  - specified using a window specification (OVER clause)
  - based on three main concepts
    - window partitioning is similar to forming groups, but rows are retained
    - window ordering defines an order (sequence) of rows within each partition
    - window frame is defined relative to each row to further restrict the set of rows
- Window function
  - is applied for each row, over the current row window, returning a single value
  - used in column expressions in the select-list

## The Partitioning Clause

 The partition-clause allows to subdivide the rows into partitions, much like the group by clause

- Without further clauses, the current row window contains all the rows of the same partition (i.e., all the rows that are not distinct from the current row, including the current row)
  - if no partitioning clause is specified, then there is a single partition that contains the complete table
- Windows do not reach across partition boundaries!

6

Recent Developments for Data Models

#### Set Functions as Window Functions

- The OVER clause turns a set function into a window function
  - Aggregated value is computed per current row window (here: per partition) select empnum, dept, salary,

avg(salary) over (partition by dept) as dept\_avg
from emptab;

EMPNUM	DEPT	SALARY	DEPT_AVG
6	1	78000	63833
2	1	75000	63833
7	1	75000	63833
11	1	53000	63833
5	1	52000	63833
1	1	50000	63833
9	2	51000	51000
4	2	1	51000
8	3	79000	69667
12	3	75000	69667
10	3	55000	69667
3	-	84000	84000
0	-	-	84000

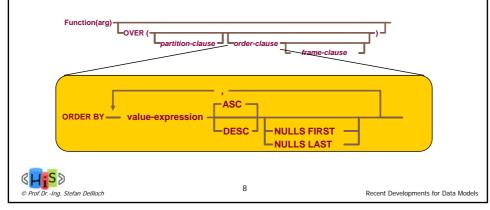

7

Recent Developments for Data Models

### The Order Clause

- The order-clause defines an order (sequence) within a partition
- May contain multiple order items
  - Each item includes a value-expression
  - NULLS FIRST/LAST defines ordering semantics for NULL values
- This clause is completely independent of the query's ORDER BY clause

## **Ranking Functions For Sequences**

- RANK
  - returns the relative position of a value in an ordered group
  - equal values (ties) are ranked the same
- DENSE\_RANK
  - like RANK, but no gaps in rankings in the case of ties
- ROW\_NUMBER
  - ties are non-deterministically numbered
- Ordering is required!
- Example:

```
select empnum, dept, salary,
    rank() over (order by salary desc nulls last) as rank,
    dense_rank() over (order by salary desc nulls last) as denserank,
    row_number() over (order by salary desc nulls last) as rownum
from emptab;
```

9

Recent Developments for Data Models

# Ranking Functions Example

EMPNUM	DEPT	SALARY	RANK	DENSERANK	ROWNUM
3	-	84000	1	1	1
8	3	79000	2	2	2
6	1	78000	3	3	3
2	1	75000	4	4	4
7	1	75000	4	4	5
12	3	75000	4	4	6
10	3	55000	7	5	7
11	1	53000	8	6	8
5	1	52000	9	7	9
9	2	51000	10	8	10
1	1	50000	11	9	11
4	2	-	12	10	12
0	-	-	12	10	13

10

Recent Developments for Data Model:

#### Example: Rank with Ordering and Partitioning

Find rankings of each employee's salary within her department

select empnum, dept, salary,

rank() over (order by salary desc nulls last) as globalrank from emptab;

EMPNUM	DEPT	SALARY	RANK_IN_DEPT	RANK
6	1	78000	1	3
2	1	75000	2	4
7	1	75000	2	4
11	1	53000	4	8
5	1	52000	5	9
1	1	50000	6	11
9	2	51000	1	10
4	2	-	2	12
8	3	79000	1	2
12	3	75000	2	4
10	3	55000	3	7
3	-	84000	1	1
0	-	-	2	12

11

Recent Developments for Data Models

## Rank on Aggregations

- Windowed table functions are computed in the select list
  - After applying FROM, WHERE, GROUP BY, HAVING
  - They may not be referenced in any of these clauses
  - May use aggregation functions in window specification expressions
  - If you wish to reference them, you must nest them, or use a common table expression
- Example: Find rankings of each department's total salary select dept, sum(salary) as sumsal,

rank() over (order by sum(salary) desc nulls last) as rankdept

from emptab

group by dept;

DEPT	SUMSAL	RANKDEPT
1	383000	1
3	209000	2
-	84000	3
2	51000	4

12

Recent Developments for Data Models

- Without a frame-clause, the current row window is now restricted to all rows equal to or preceding the current row within the current partition
  - Example: Find the total sales per quarter, and cumulative sales in quarter order PER YEAR for 1993-1995

select year, quarter, sum(s.dollars) as q\_sales,

sum(sum(s.dollars)) over (partition by year order by quarter) as cume\_sales\_year

from sales s where year between 1993 and 1995 group by year, quarter;

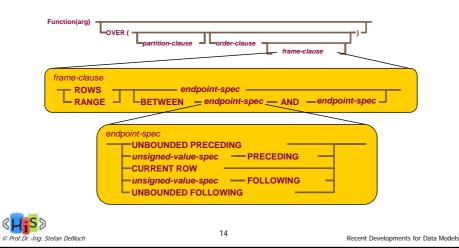

YEAR	QUARTER	Q_SALES	CUME_SALES_YEAR
1993	1	1270775.75	1270775.75
1993	2	1279171.45	2549947.20
1993	3	1050825.44	3600772.64
1993	4	1062329.99	4663102.63
1994	1	1176312.84	1176312.84
1994	2	1132602.73	2308915.57
1994	3	1241437.72	3550353.29
1994	4	1103020.49	4653373.78
1995	1	1193343.62	1193343.62
1995	2	1194296.14	2387639.76
1995	3	1418400.68	3806040.44
1995	4	1182153.01	4988193.45
12		·	

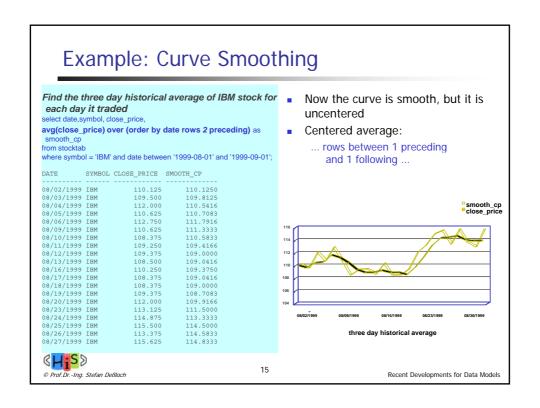

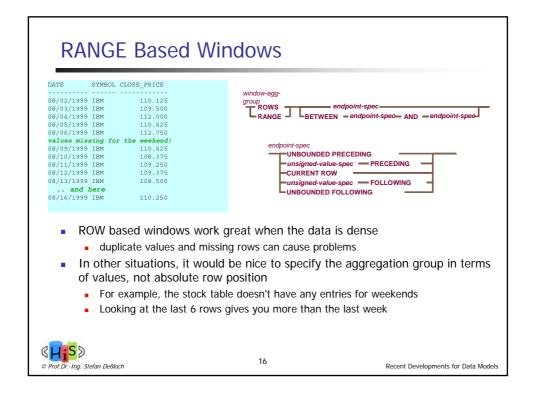

Recent Developments for Data Models

#### Window Frames

- Further refine the set of rows in a function's window when an order by is present
  - Allows inclusion/exclusion of ranges of values or rows within the ordering

## RANGE Based Window Example

For IBM stock, what is the 7 **calendar day** historical average, and the 7 **trade day** historical average for each day in the month of August, 1999

```
select date,substr(dayname(date),1,9), close_price,
avg(close_price) over (order by date rows 6 preceding) as avg_7_rows,
count(close_price) over (order by date rows 6 preceding) as count_7_rows,
avg(close_price) over (order by date range interval '6' day preceding) as avg_7_range,
count(close_price) over (order by date range interval '6' day preceding) as count_7_range
from stocktab
where symbol = 'IBM' and date between '1999-08-01' and '1999-09-01';
```

DATE	2	CLOSE_PRICE	AVG_7_ROWS	COUNT_7_ROWS	AVG_7_RANGE	COUNT_7_RANGE
08/02/1999	Monday	110.125	110.12	1	110.12	1
08/03/1999	Tuesday	109.500	109.81	2	109.81	2
08/04/1999	Wednesday	112.000	110.54	3	110.54	3
08/05/1999	Thursday	110.625	110.56	4	110.56	4
08/06/1999	Friday	112.750	111.00	5	111.00	5
08/09/1999	Monday	110.625	110.93	6	111.10	5
08/10/1999	Tuesday	108.375	110.57	7	110.87	5
08/11/1999	Wednesday	109.250	110.44	7	110.32	5
08/12/1999	Thursday	109.375	110.42	7	110.07	5
08/13/1999	Friday	108.500	109.92	7	109.22	5
08/16/1999	Monday	110.250	109.87	7	109.15	5
08/17/1999	Tuesday	108.375	109.25	7	109.15	5

17

Recent Developments for Data Models

## **Explicit Window Definition Clause**

- So far, a window was specified "in-line" in the SELECT clause of a query
- Alternative syntax uses an explicit WINDOW clause

```
select date, symbol, close_price,
```

avg(close\_price) over w as smooth\_cp

from stocktab

where symbol = 'IBM' and date between '1999-08-01' and '1999-09-01'

window w as (order by date rows 2 preceding)

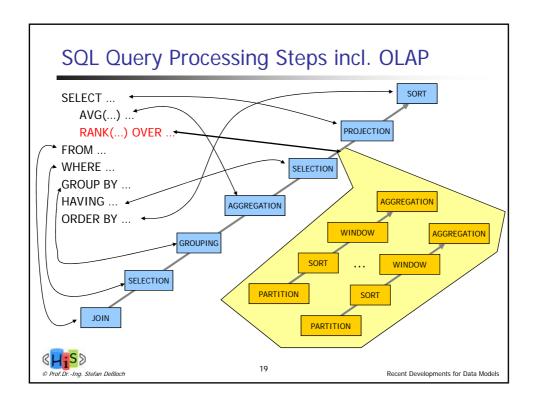

- Advantages
  - window has a name, which can be used by multiple window table function invocations in the SELECT clause

18

Recent Developments for Data Models

SS2008

## **Additional Capabilities**

- Hypothetical Aggregate Functions
  - 4 new hypothetical aggregate functions:
    - RANK (expr, expr ...) WITHIN GROUP (ORDER BY <sort specification list>)
    - DENSE\_RANK (expr, expr ...) WITHIN GROUP (ORDER BY <sort specification list>)
    - PERCENT\_RANK (expr, expr ...) WITHIN GROUP (ORDER BY <sort specification list>)
    - CUME\_DIST (expr, expr ...) WITHIN GROUP (ORDER BY <sort specification list>)
  - Hypothetical aggregate functions evaluate the aggregate over the window extended with a new row derived from the specified values.
    - "What if" scenarios
- Inverse Distribution Functions
  - 2 new inverse distribution functions:
    - PERCENTILE\_DISC (expr) WITHIN GROUP (ORDER BY <sort specification list>)
    - PERCENTILE\_CONT (expr) WITHIN GROUP (ORDER BY <sort specification list>)
  - Argument must evaluate to a value between 0 and 1.
  - Return the values of expressions specified in <sort specification list> that correspond to the specified percentile value.

20

Recent Developments for Data Models

#### SQL:2003 Built-in Functions for OLAP

- 34 new built-in functions:
  - 7 new numeric functions
  - 16 new aggregate functions
  - 5 new windowed table functions
  - 4 new hypothetical aggregate functions
  - 2 new inverse distribution functions
- Windowed table functions provide facilities for calculating moving sums, moving averages, ranks, correlation, standard deviation, regression, etc.
- Significant functionality and performance advantages for OLAP applications

21

Recent Developments for Data Models

## **New Built-in Functions**

- 7 new numeric functions
  - LN (expr)
  - EXP (expr)
  - POWER (expr, expr)
  - SQRT (expr)
  - FLOOR (expr)
  - CEIL[ING] (expr)
  - WIDTH\_BUCKET(expr, expr, expr, expr)
     EX: WIDTH\_BUCKET (age, 0, 100, 10)
- 16 new aggregate functions
  - STDDEV\_POP (expr)
  - STDDEV\_SAMP (expr)
  - VAR\_POP (expr)
  - VAR\_SAMP (expr)
  - COVAR\_POP (expr, expr)
  - COVAR\_SAMP (expr, expr)
  - CORR (expr, expr)
  - REGR\_SLOPE (expr, expr)
  - REGR\_INTERCEPT (expr, expr)
  - REGR\_COUNT (expr, expr)
  - REGR\_R2 (expr, expr)
  - REGR\_AVGX (expr, expr)
  - REGR\_AVGY (expr, expr)REGR\_SXX (expr, expr)
  - REGR\_SYY (expr, expr)
  - REGR\_SXY (expr, expr)

22

Recent Developments for Data Models

# **Summary**

- OLAP-Functionality in SQL
  - extension of classical application of aggregation functions
- Windowed tables, window functions
  - tuple-based, attribute-based partitioning and analysis/aggregation of data
  - rows in a partition are preserved/expanded
    - in contrast to group-by/aggregation
  - window order defines sequence for sequence-based analysis
    - cumulative aggregation, ranking
  - window frame defines current row window dynamically for ordered windows
    - moving aggregates
- Multiple windows can be defined for the same table
  - windows are independent
- SQL query execution model enhancement
- This functionality provides powerful infrastructure for optimized data analysis in the scope of OLAP
