

Chapter 3 DB-Gateways

Outline

- Coupling DBMS and programming languages
 - approaches
 - requirements
- Programming Model (JDBC)
 - overview
 - DB connection model
 - transactions
- Data Access in Distributed Information System Middleware
- DB-Gateways
 - architectures
 - ODBC
 - JDBC
- SQL/OLB – embedded SQL in Java
- Summary

Coupling Approaches – Overview

- Embedded SQL
 - (static) SQL queries are embedded in the programming language
 - cursors to bridge so-called impedance mismatch
 - preprocessor converts SQL into function calls of the programming language
 - potential performance advantages (early query compilation)
 - vendor-specific
- Dynamic (embedded) SQL
 - SQL queries can be created dynamically by the program
 - character strings interpreted as SQL statements by an SQL system
- Call-Level Interface (CLI)
 - standard library of functions that can be linked to the program
 - same capabilities as (static and dynamic) embedded
 - SQL queries are string parameters of function invocation
 - avoids vendor-specific precompiler

Coupling Approaches (Examples)

- Embedded SQL
 - static
 - Example:
`exec sql declare c cursor for
 SELECT empno FROM Employees WHERE dept = :deptno_var;
exec sql open c;
exec sql fetch c into :empno_var;`
 - dynamic
 - Example:
`strcpy(stmt, "SELECT empno FROM Employees WHERE dept = ?");
exec sql prepare s1 from :stmt;
exec sql declare c cursor for s1;
exec sql open c using :deptno_var;
exec sql fetch c into :empno_var;`
- Call-Level Interface (CLI)
 - Example:
`strcpy(stmt, "SELECT empno FROM Employees WHERE dept = ?");
SQLPrepare(st_handle, stmt, ...);
SQLBindParam(st_handle, 1, ..., &deptno_var, ...);
SQLBindCol(st_handle, 1, ..., &empno_var, ...);
SQLExecute(st_handle);
SQLFetch(st_handle);`

Standard Call Level Interfaces - Requirements

- Uniform database access
 - query language (SQL)
 - meta data (both query results and DB-schema)
 - Alternative: SQL Information Schema
 - programming interface
- Portability
 - call level interface (CLI)
 - no vendor-specific pre-compiler
 - application binaries are portable
 - but: increased application complexity
 - dynamic binding of vendor-specific run-time libraries
- Dynamic, late binding to specific DB/DBS
 - late query compilation
 - flexibility vs. performance

5

Middleware for Information Systems

Additional Requirements for DB-Gateways

- Remote data access
- Multiple simultaneously active DB-connections within the same application thread
 - to the same DB
 - to different DBs
 - within the same (distributed) transaction
- Simultaneous access to multiple DB/DBMS
 - architecture supports use of (multiple) DBMS-specific drivers
 - coordinated by a driver manager
- Support for vendor-specific extensions

© Prof. Dr.-Ing. Stefan DeBloch

6

Middleware for Information Systems

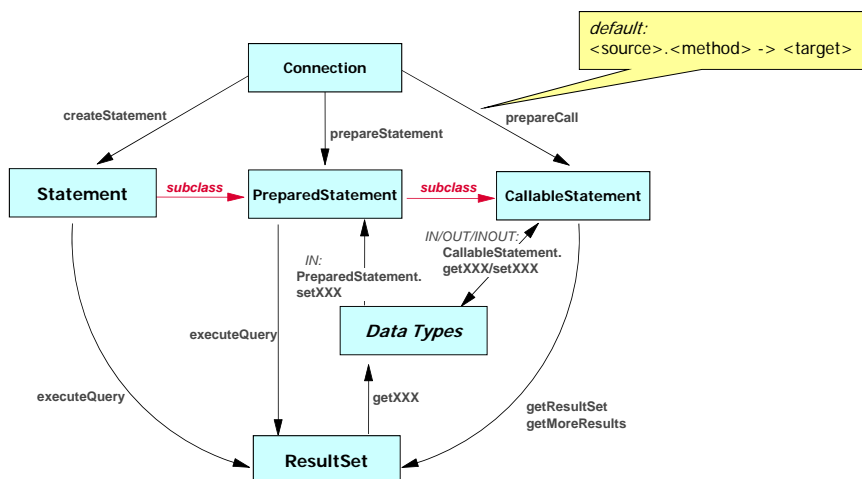

Historical Development

- ODBC: Open Database Connectivity
 - introduced in 1992 by Microsoft
 - quickly became a de-facto standard
 - ODBC drivers available for almost any DBMS
 - "blueprint" for ISO SQL/CLI standard
- JDBC
 - introduced in 1997, initially defined by SUN, based on ODBC approach
 - leverages advantages of Java (compared to C) for the API
 - abstraction layer between Java programs and SQL
 - current version: JDBC 4.0 (Dec. 2006)

Java application
JDBC 4.0
SQL-92, SQL:1999, SQL:2003
(object-) relational DBS

JDBC – Core Interfaces

Example: JDBC

```
String url = "jdbc:db2:mydatabase";  
...  
Connection con = DriverManager.getConnection(url, "dessloch", "pass");  
  
String sqlstr = "SELECT * FROM Employees WHERE dept = 1234";  
Statement stmt = con.createStatement();  
  
ResultSet rs = stmt.executeQuery(sqlstr);  
  
while (rs.next() ) {  
    String a = rs.getString(1);  
    String str = rs.getString(2);  
    System.out.print(" empno= " + a);  
    System.out.print(" firstname= " + str);  
    System.out.print("\n");  
}
```

9

Middleware for Information Systems

JDBC – Processing Query Results

- ResultSet
 - getXXX-methods
 - scrollable ResultSets
 - updatable ResultSets
- Data types
 - conversion functions
 - streams to support large data values
 - with JDBC 2.0 support of SQL:1999 data types
 - LOBS (BLOBS, CLOBS)
 - arrays
 - user-defined data types
 - references

© Prof. Dr.-Ing. Stefan DeBloch

10

Middleware for Information Systems

JDBC – Additional Functionality

- Metadata
 - methods for metadata lookup
 - important for generic applications
- Exception Handling
- Batch Updates
- Savepoints
- RowSets
- ...

Transactions in JDBC

- Connection interface – transaction-oriented methods for local TAs
 - *begin is implicit*
 - `commit()`
 - `rollback()`
 - `get/setTransactionIsolation()`
 - NONE, READ_UNCOMMITTED, READ_COMMITTED, REPEATABLE_READ, SERIALIZABLE
 - `get/setAutoCommit()`
- Here, the scope of the transaction is a single connection!
 - support for distributed transactions requires additional extensions, interactions with a transaction manager (*see subsequent chapters*)

JDBC DataSource

- DataSource Interface
 - motivation: increase portability by abstracting from driver-specific connection details
 - application uses logical name to obtain connection, interacting with Java Naming and Directory Service (JNDI)
 - connections can be created, registered, reconfigured, directed to another physical DB without impacting the application
 - example: connections are set up and managed by an application server administrator
- Steps
 - DataSource object is created, configured, registered with JNDI
 - using administration capability of application server
 - outside the application component
 - application component obtains a DataSource object
 - JNDI lookup
 - no driver-specific details required
 - application obtains a Connection object using DataSource
 - DataSource.getConnection()

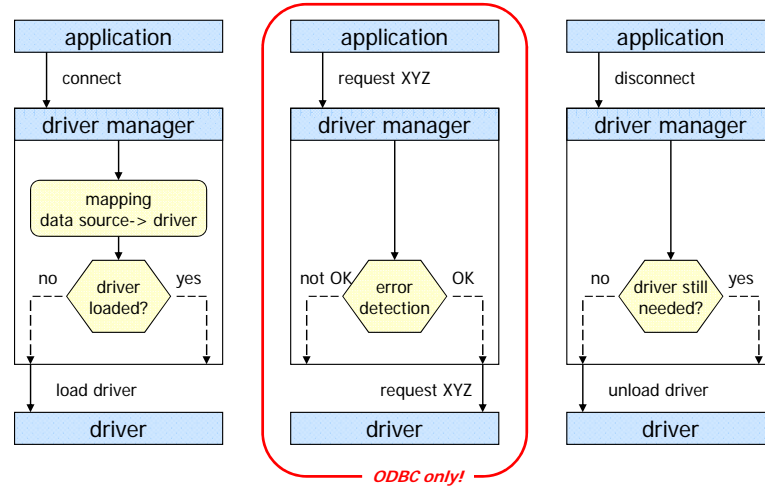

Architecture

- Applications
 - programs using DB-CLI functionality
 - usage
 - connect to data sources
 - execute SQL statements (e.g., queries) over data sources
 - receive (and process) results
- Driver
 - processes CLI calls
 - communicates SQL requests to DBMS
 - Alternative: does the entire processing of the SQL requests
 - hides heterogeneity of data sources
- Driver Manager
 - manages interactions between applications and drivers
 - realizes (n:m)-relationship between applications and drivers
 - tasks
 - load/unload driver
 - mapping data sources to drivers
 - communication/logging of function/method calls
 - simple error handling

Driver Manager Tasks

© Prof. Dr.-Ing. Stefan DeBloch

15

Middleware for Information Systems

Driver – Tasks and Responsibilities

- Connection Management
- Error handling
 - standard error functions/codes/messages, ...
- Translation of SQL requests
 - if syntax of DBMS deviates from standard SQL
- Data type mapping
- Meta data functions
 - access (proprietary) system catalogs
- Information functions
 - provide information about driver (self), data sources, supported data types and DBMS capabilities
- Option functions
 - Parameter for connections and statements (e.g., statement execution timeout)

© Prof. Dr.-Ing. Stefan DeBloch

16

Middleware for Information Systems

Realization Alternatives

- ODBC driver types
 - one-tier
 - two-tier
 - three-tier
- JDBC driver types
 - Type 1: JDBC-ODBC bridge
 - Type 2: Part Java, Part Native
 - Type 3: Intermediate DB Access Server
 - Type 4: Pure Java
- Application does not "see" realization alternatives!

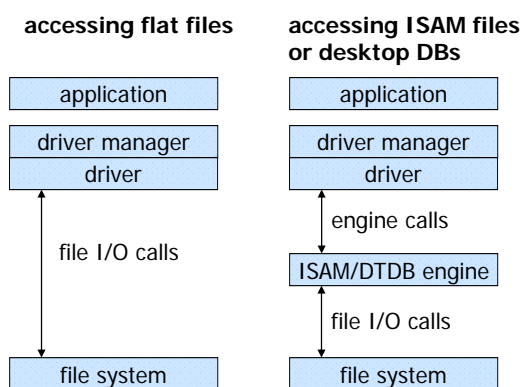

© Prof. Dr.-Ing. Stefan Deßloch

17

Middleware for Information Systems

Single-Tier Driver

- Used to access flat files, ISAM files, desktop databases
- Data resides on the same machine as the driver
- Functionality:
 - complete SQL processing (parse, optimize, execute)
 - often lacks multi-user and transaction support

© Prof. Dr.-Ing. Stefan Deßloch

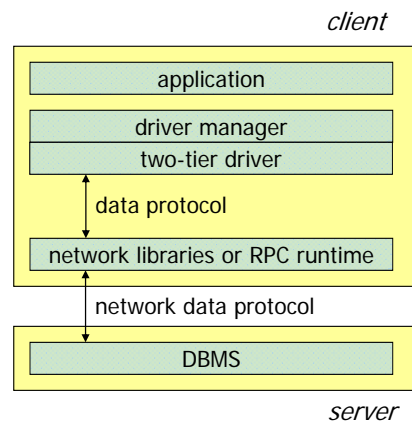

18

Middleware for Information Systems

Two-Tier Driver

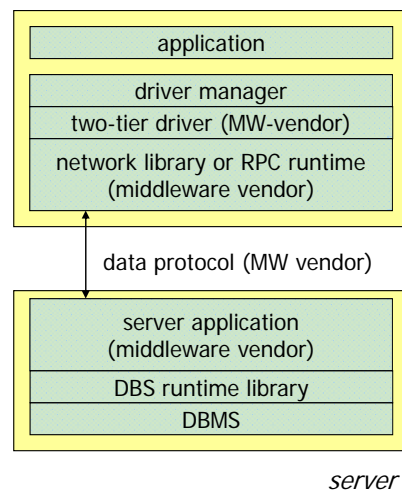

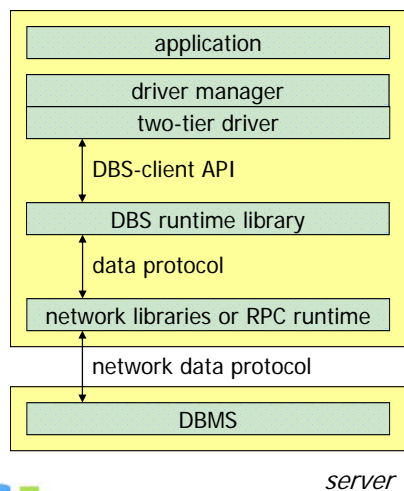

- Classical client/server support
 - driver acts as a client interacting with DBMS (server) through data protocol
- Implementation alternatives
 1. direct data protocol support
 2. mapping ODBC to DBMS-client API
 3. middleware solution
- Direct data protocol support
 - message-based or RPC-based
 - utilizes DBMS-specific network libraries or RPC runtime

Direct data protocol support

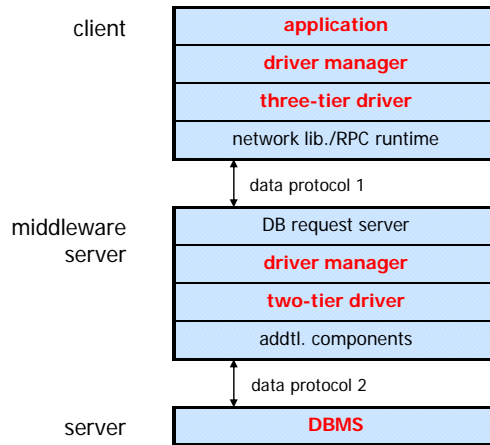

Two-Tier Driver (continued)

- Mapping to DBMS-client API *client*
- Middleware solution *client*

Three-Tier Driver

- **Middleware Server**
 - connects and relays requests to one or more DBMS servers
- Moves the complexity from the client to the middleware server
 - client requires only a single driver (for the middleware server)
- Arbitrary number of tiers possible

JDBC Driver Types

Partial Java

- **Type 1: JDBC-ODBC bridge**
 - 2-tier
 - mapping to ODBC API
 - uses Java Native Interface (JNI)
 - requires native binaries at the client
- **Type 2: Native-API Partial-Java driver**
 - 2-tier
 - uses a native DBMS client library
 - requires binaries at the client

All-Java

- **Type 3: Net-Protocol All-Java driver**
 - 3-tier
 - driver on client is pure Java
 - communicates with JDBC server/gateway
 - no native binaries on client required
 - applet-based DB access is possible
- **Type 4: Native-Protocol All-Java driver**
 - 2-tier
 - pure Java
 - implements the network data protocol of the DBMS
 - directly connects to the data source
 - no native binaries on client required
 - applet-based DB access is possible

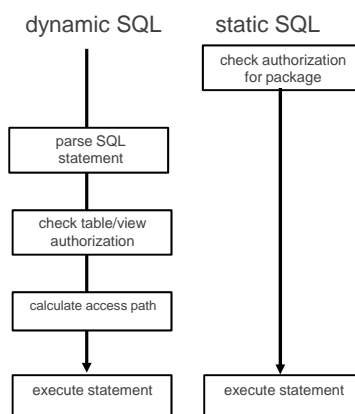

SQL Object Language Bindings (OLB)

- aka SQLJ Part 0
- Static, embedded SQL in Java
 - Development advantages over JDBC
 - more concise, easier to code
 - static type checking, error checking at precompilation time
 - Permits static authorization
- Can be used in client code and stored procedures
- SQLJ translator/customizer framework supports binary compatibility
 - SQLJ translator implemented using JDBC
 - produces statement profiles
 - vendor-specific customizers
 - can add different implementation, to be used instead of default produced by translator
 - potential performance benefits
 - resulting binary contains default and possibly multiple customized implementations
- Interoperability with JDBC
 - combined use of SQLJ with JDBC for flexibility

SQL/OLB

- Static SQL authorization option
 - Static SQL is associated with "program"
 - Plans/packages identify "programs" to DB
 - Program author's table privileges are used
 - Users are granted EXECUTE on program
 - Dynamic SQL is associated with "user"
 - No notion of "program"
 - End users must have table privileges
 - BIG PROBLEM FOR A LARGE ENTERPRISE !!!
- Static SQL syntax for Java
 - INSERT, UPDATE, DELETE, CREATE, GRANT, etc.
 - Singleton SELECT and cursor-based SELECT
 - Calls to stored procedures (including result sets)
 - COMMIT, ROLLBACK
 - Methods for CONNECT, DISCONNECT

SQL/OLB vs. JDBC: Retrieve Single Row

- SQL OLB

```
#sql [con] { SELECT ADDRESS INTO :addr FROM EMP  
WHERE NAME=:name };
```

- JDBC

```
java.sql.PreparedStatement ps = con.prepareStatement(  
    "SELECT ADDRESS FROM EMP WHERE NAME=?");  
ps.setString(1, name);  
java.sql.ResultSet names = ps.executeQuery();  
names.next();  
name = names.getString(1);  
names.close();
```

Result Set Iterators

- Mechanism for accessing the rows returned by a query
 - Comparable to an SQL cursor
- Iterator declaration clause results in generated iterator class
 - Iterator is a Java object
 - Iterators are strongly typed
 - Generic methods for advancing to next row
- Assignment clause assigns query result to iterator
- Two types of iterators
 - Named iterator
 - Positioned iterator

Named Iterators - Example

- Generated iterator class has accessor methods for each result column

```
#sql iterator Honors ( String name, float grade );
Honors honor;
...
#sql [recs] honor =
{ SELECT SCORE AS "grade", STUDENT AS "name"
  FROM GRADE_REPORTS
  WHERE SCORE >= :limit AND ATTENDED >= :days
  ORDER BY SCORE DESCENDING };
while (honor.next())
{
  System.out.println( honor.name() + " has grade "
    + honor.grade() );
}
```

Positioned Iterator

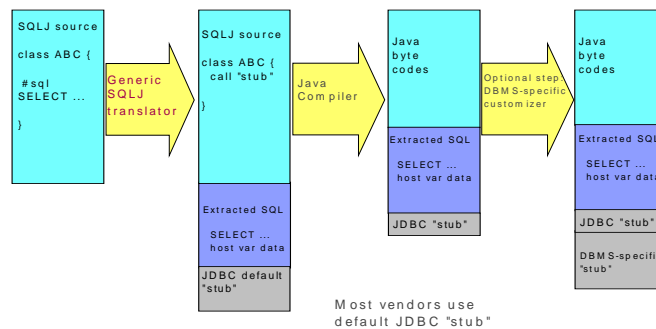

- Use FETCH statement to retrieve result columns into host variables based on position

```
#sql iterator Honors ( String, float );
Honors honor;
String name;
float grade;
#sql [recs] honor =
{ SELECT STUDENT, SCORE FROM GRADE_REPORTS
  WHERE SCORE >= :limit AND ATTENDED >= :days
  ORDER BY SCORE DESCENDING };
while (true) {
  #sql {FETCH :honor INTO :name, :grade };
  if (honor.endFetch()) break;
  System.out.println( name + " has grade " + grade );
}
```

SQLJ - Binary Portability

- Java as a platform-independent language
- Use of generic SQLJ-precompiler/translator (avoids DBMS-specific precompiler technology)
- Generated code uses "standard" JDBC by default
- Compiled SQLJ application (Java byte code) is portable
- Customizer technology allows DBMS-specific optimizations after the compilation

© Prof. Dr.-Ing. Stefan Dießloch

29

Middleware for Information Systems

Summary

- Gateways
 - ODBC / JDBC
 - support uniform, standardized access to heterogeneous data sources
 - encapsulate/hide vendor-specific aspects
 - multiple, simultaneously active connections to different databases and DBMSs
 - driver/driver manager architecture
 - enabled for distributed transaction processing
 - high acceptance
 - important infrastructure for realizing IS distribution at DB-operation level
 - no support for data source integration
- JDBC
 - 'for Java', 'in Java'
 - important basis for data access in Java-based middleware (e.g., J2EE)
- SQLJ
 - combines advantages of embedded SQL with portability, vendor-independence
